## **Introduction**

This document contains additional information cited to support the main articles' contentions, and uncited additional matrix and species parameters, for both context and future regional and global comparisons

Table S1 the Middle bank seagrass (Penang, Malaysia) sediment variables and locations. Note that pore water salinities were relatively constant across the meadow (30‰) as measured with a portable refractometer at stations 1, 2, 6, 8, and 15. All carbon contents were corrected for salt from their water content, obtained during dry bulk density measurements, and salinity of 30‰

<b>Station number</b>	<b>Latitude (decimal degree)</b>	<b>longitude (decimal degree)</b>	<b>Dry bulk density (g/ml)</b>	<b>TOC (%)</b>	<b>BC (%)</b>	<b>PIC (%)</b>
